Agenda

- What's Homebrew?

- Why use a package manager?

- What's the difference?

- Demo

What's Homebrew?

Homebrew

The missing package manager for macOS

Why use a package manager?

Homebrew installs the stuff you need that Apple didn't.

- Install UNIX tools, macOS apps — and even fonts

- Reproducible configurations stored as code

- Easily automate environment setup

- Trivial updates: `brew outdated; brew upgrade`

What's the difference?

- Homebrew downloads the latest version of the toolkit

- Installs it in a subfolder of the local package Cellar

- Symlinks command to `/usr/local/bin/dita`

- Runs anywhere without `$PATH` fiddling
- No Windows baggage

Demo

Show me, show me, show me…

— how you do that trick
